

# How to display a web page?

- Add a WebView to your GUI
- If the web page is a resource of the application:
  - Create an assets folder: File menu / New / Folder / Assets Folder
  - Place your HTML file in the assets folder
  - `String url = "file:///android_asset/myPage.html"`
- If the web page is hosted on the Internet
  - `String url = "http://myserver/myPage.html"`
  - Request permission to access the Internet. In the AndroidManifest.xml file:  
**<uses-permission android:name="android.permission.INTERNET"/>**
- Load the web page in the WebView:  
`webView.loadUrl(url);`
- To avoid that links open into a browser activity:  
`webView.setWebViewClient(new WebViewClient());`
