

How to provide your app in multiple languages?

1. Do not hard-code message strings, instead:
 - a. Define a new <key, value> couple for each message string in the res/values/strings.xml file
 - b. In the code, refer to the separately defined message string:
In XML: @string/key
In java: R.string.key
2. Use the translations editor for the strings.xml file to
 - a. Add a locale
 - b. Provide translation for each declared string message

How to provide a list of items?

- Use the ListView container view
- ArrayAdapter provides:
 - Content / items (from an array)
 - Layout defining how items are rendered
- To react to item selection: add an OnItemClickListener
